

# Key affected populations, HIV and AIDS

People who belong to key affected populations (KAPs) are people who, for one reason or another, are more vulnerable to HIV infection.

This could be because they engage in high-risk behaviours such as injecting drugs, or because they are marginalised by society and fearful of accessing HIV services.

An effective response to the HIV epidemic requires that these groups are targeted by HIV prevention programmes with information and services that are specific to them.

## MSM

Men who have sex with men (MSM)

Homosexual acts are illegal in more than a third of countries, preventing men who have sex with men (MSM) from accessing HIV services.

## Drug.jpg

People who inject drugs (PWID)

14% of all people who inject drugs are living with HIV. People who inject drugs are repeatedly denied access to harm reduction programmes.

## Sex workers.jpg

Sex workers

Sex workers are 12 times more likely to be living with HIV than the general population and are difficult for HIV services to reach.

## Prisoner.jpg

## Transgender women in HIV clinic

## Prisoners

Incarceration increases HIV vulnerability, especially when prisoners engage in high risk behaviours like injecting drugs.

---

## Transgender people

Being transgender is strongly associated with stigma and discrimination. Transgender people also lack access to tailored HIV services.

---

## Women and girls

Women are often vulnerable to HIV due to unequal gender relations which affects their ability to negotiate condom use.

---

## childrens page image cropped.jpg

## Children

160,000 children became infected with HIV in 2016, the majority of which were from mother-to-child during pregnancy or breastfeeding.

---

## Young people at school

## Young people and adolescents

Young people are a priority for HIV prevention messages because it's most effective to change behaviour before sexual debut.

---

## Disabilities page.jpg

## People with disabilities

There is growing evidence that people with disabilities are likely to be at higher risk of HIV infection than able-bodied people.
