The history of the HIV epidemic is a relatively short one. In the early years, HIV was unknown, feared, untreatable and often fatal. However, over the past 30 years we have come a long way in our understanding of it, where it came from, how it evolved, and most importantly, how to treat and prevent it.

Governments and civil society have increasingly committed to the response with more money channelled towards understanding HIV, and into developing different treatments.

Here we look at the origins of HIV and AIDS, and the key historical moments of the epidemic.
