HIV and AIDS in Asia and the Pacific

The HIV epidemic in Asia and the Pacific varies throughout the region. For example, new HIV infections in South and South-East Asia are decreasing, whereas in East Asia, they are rising.

Across all countries, key affected populations are vulnerable and being left behind. 18 countries in the region still criminalise same-sex activities, while drug detention centres punish people who use drugs and deny them access to HIV treatment and harm reduction methods.

However, other legal reforms have been positive, such as the formal recognition of transgender as a third gender in Pakistan and India.

Asia & the Pacific regional overview

5.8 million people are living with HIV in Asia & the Pacific. China has made substantial progress in tackling its HIV epidemic, however the number of new infections is rising. China (2015) 501,000 people living with HIV. <0.1% adult HIV prevalence (2014) 115,000 new HIV infections (2015) 21,000 AIDS-related deaths (2014) 285,000 adults on antiretroviral treatment* 66% children on antiretroviral treatment* *All adults/children living with HIV Source: UNAIDS 2015

56% adults on antiretroviral treatment* 1.1% children on antiretroviral treatment* *All adults/children living with HIV Source: UNAIDS 2015

India (2017) 2.1m people living with HIV 0.2% adult HIV prevalence (ages 15-49) 88,000 new HIV infections 69,000 AIDS-related deaths 56% adults on antiretroviral treatment* 1.0% children on antiretroviral treatment* *All adults/children living with HIV Source: UNAIDS 2015

5% adults on antiretroviral treatment* 0.1% children on antiretroviral treatment* *All adults/children living with HIV Source: UNAIDS 2015

China

HIV prevalence in India is only 0.2%, but its huge population means this equates to over 2.1 million people living with HIV.
